

How to publish with Nature Portfolio

Ching-Yu Huang

Chief Editor for Immunology, Nature Communications, Springer Nature

Publishing their findings is essential for researchers regarding their career, recognition, and contribution to the community, yet to many the process of publication remains a black box: many manuscripts go in, but only few come out, and few know why. This thus presents an obstacle for sharing one's hard works by publicizing them on a journal with matching scope, reputation and readership. In this presentation, I wish to first introduce to you our journals, Nature Communications and Nature Immunology, about their scope, goal and general metrics. I will then share with you information about our editorial processing, such as editorial criteria, referee selection, decision consideration, and post-decision actions. Lastly, I will provide concise, high-level suggestions on manuscript composition and presentation. I am hoping that this information may enhance your chance of publishing on a suitable scientific journal.
